AI-Powered Equine Conformation Analysis Report

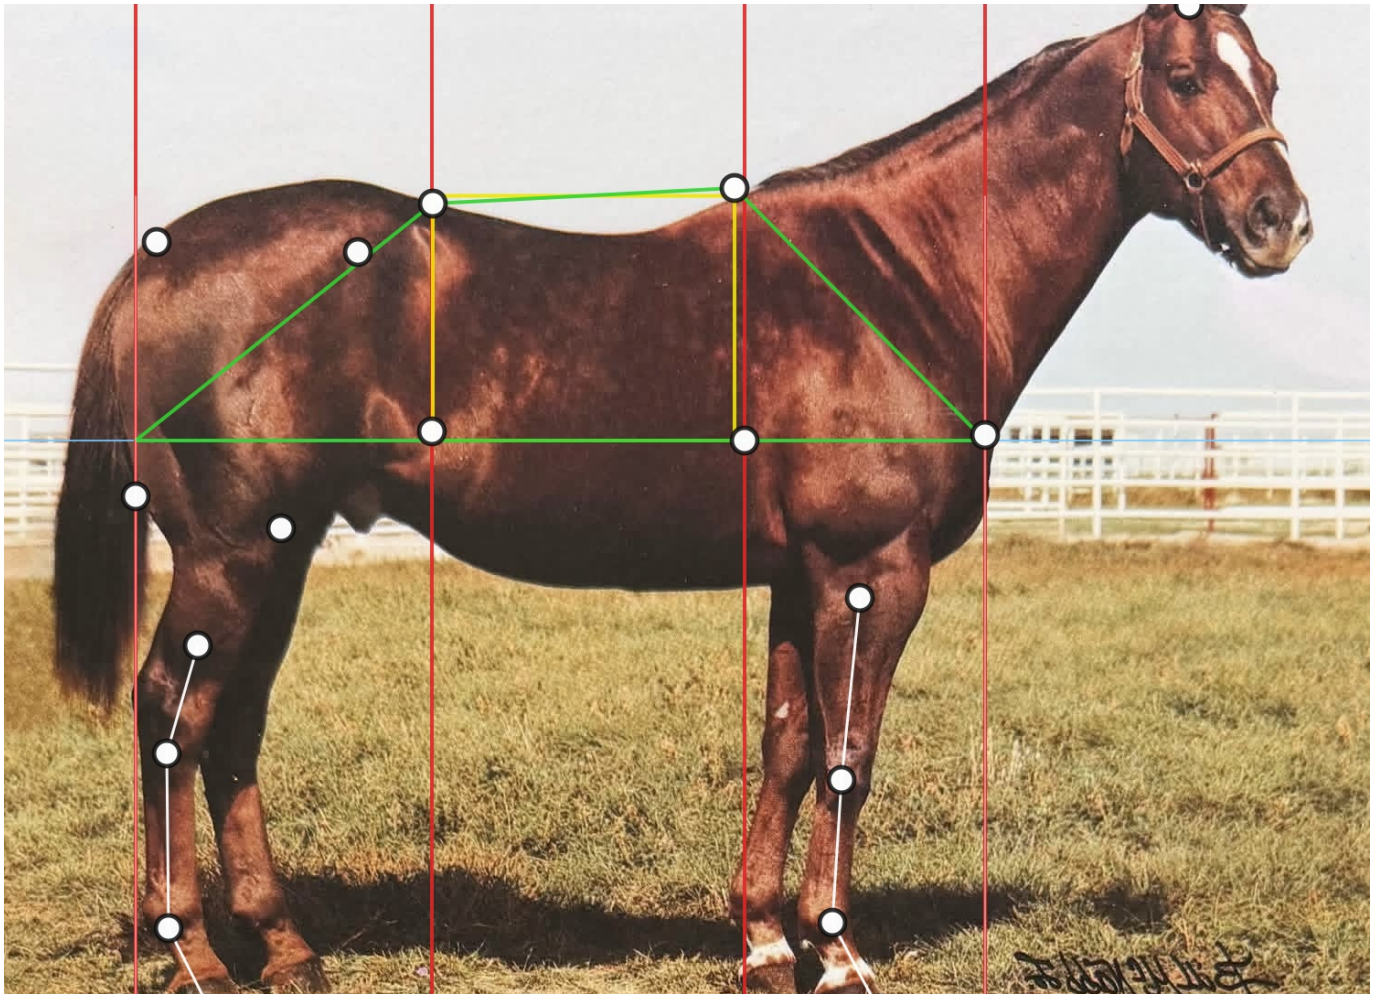

Easy Jet

Breed: Quarter Horse

Age: 25 years (deceased) · Sex: Stallion · Coat Color: Sorrel

Discipline: Barrel Racing, Rodeo, Racing

Overall Score: 91 / 100

Conformation Scores

Balance (rule of thirds)	92 / 100
Shoulder Angle	85 / 100
Hip Angle	94 / 100
Topline Quality	88 / 100
Leg Alignment	86 / 100

Written Report

This sorrel Quarter Horse stallion represents an excellent example of barrel racing and rodeo breeding. His standout feature is an exceptional hindquarter with superior muscling and angle—the engine that drives speed events. Combined with balanced proportions, strong loin coupling, and a functional shoulder, this stallion shows why he was likely a successful sire. For a 25-year-old, the structural integrity and muscle tone visible in this photo demonstrate he was built to last. Minor considerations include a shoulder that could have slightly more slope, but this is compensated by his powerful hip and overall athletic build.

Balance (rule of thirds)

This stallion exhibits exceptional balance with near-perfect rule of thirds proportions. The body divides evenly from shoulder to heartgirth to hip, with the underline appropriately longer than the topline. Depth through the heartgirth matches depth through the flank, creating that desirable rectangular frame for a performance horse. His overall mass is well-distributed, with substantial hindquarters balancing a moderately deep chest.

Shoulder Angle

Shoulder angle appears to be approximately 50-52 degrees, which falls within the acceptable performance range. The layback is moderate rather than extreme, typical of many successful barrel racing and rodeo stallions. This angle, paired with adequate wither height, allows for sufficient stride reach while maintaining the quick, collected movement essential for speed events. Slightly more slope would be ideal for pure speed, but this shoulder has served well for explosive acceleration.

Hip Angle

This stallion possesses an outstanding hindquarter—the powerhouse for barrel racing. The hip is long from point of hip to point of buttock with excellent depth. Croup angle appears approximately 25-30 degrees, ideal for getting the hind legs underneath for collection and explosive drive. The muscling through the stifle, gaskin, and inner thigh is exceptional, showing the genetic capacity for speed and quick directional changes. This is a breeding-quality hip.

Topline Quality

Strong, functional topline with well-defined withers that tie smoothly into the back. Back is appropriately short and strong for a performance stallion, with tight loin coupling that would transfer power efficiently from hindquarters to forehand. The croup flows smoothly without being excessively steep. For a 25-year-old stallion, the topline has held up remarkably well, indicating excellent structural integrity throughout his life.

Leg Alignment

From this profile view, front leg alignment appears correct with adequate bone and well-angled pasterns. The cannon bones are of appropriate length relative to forearm. Hind legs show proper set with good angulation through hock and stifle. Some minor white markings visible on lower legs. The stance appears natural and square. For his age, joints appear clean without obvious signs of significant arthritis or windpuffs that would indicate chronic unsoundness.
